TRICHLOROETHYLENE: Its Effect on the Sewer System and the Action Being Taken to Prevent its Disposal into the System

Transmitted herewith is a report from the Sewage Treatment Plant Supt. regarding the characteristics and properties of the chemical, "tri-chloroethylene," and the effects of this chemical on the sewer system.

The recently adopted City Sewer Ordinance ~~outlines~~ the disposal of harmful chemicals such as this into our system. The ~~problem~~, of course, is to detect the chemical, locate its ~~source~~ and prevent its disposal into the system before it has a chance to create a serious problem in the sewer system.

As mentioned in the attached report, the local electronic firms have been making earnest efforts to prevent the chemical from entering into the City system. They have installed settlement tanks and traps to retain the chemical. Fairchild is now ~~contemplating~~ constructing a new settlement tank, the plans of which have now been submitted to the City for review and approval.

Constant vigilance on the part of the Sewer Division, Bldg. Inspection Division, and the Sewage Treatment Plant employees should provide fairly effective ~~workings~~. These divisions are now on the alert for this chemical as well as other detrimental substances which may at times be deposited into the system. Immediate follow-up is made upon detection, and attempts are made to prevent recurrence.
